

Pros:

- Built directly into the browser's Developer Tools, requiring no external installations or paid subscriptions.
- Provides a clear, percentage-based score that is easy to understand at a glance.
- Pinpoints the exact failing elements in the code, such as the low contrast ratio on the email's "Shop Now" button and the undersized touch targets on YouTube's interface.

Cons:

- Strictly catches automated, programmatic issues; it cannot evaluate subjective accessibility, such as whether an image's alt text is actually helpful to a user.
- Cannot replicate the real-world navigation experience of using a screen reader (like NVDA or VoiceOver) to tab through the page.
- Can sometimes trigger strict contrast warnings on background images even if the text remains highly readable.
